

Solutions for practice in 4.2 Two-Variable Linear Systems of Equations

1. Solve by elimination

We'll eliminate y :

$$2x + 3y = 18$$

$$5x - y = 11 \quad / \cdot 3$$

$$\begin{array}{r} 2x + 3y = 18 \\ 15x - 3y = 33 \end{array} \quad \left. \begin{array}{l} \\ \\ \end{array} \right\} +$$

$$17x = 51 \quad / \div 17$$

$$x = \frac{51}{17}$$

$$x = 3$$

To find y , use

$$5x - y = 11$$

$$y = 5x - 11$$

$$y = 5 \cdot 3 - 11 = 15 - 11 = 4$$

$$\begin{array}{l} x = 3 \\ y = 4 \end{array}$$

2. Solve by elimination

$$\frac{4}{5}x + \frac{3}{5}y = \frac{3}{5} \quad / \cdot 5$$

$$\frac{3}{8}x + \frac{11}{8}y = \frac{23}{8} \quad / \cdot 8$$

I will first simplify both

$$4x + 3y = 3 \quad / \cdot 3$$

$$3x + 11y = 23 \quad / \cdot -4$$

$$12x + 9y = 9$$
$$-12x - 44y = -92$$

$$-35y = -83$$

$$y = \frac{83}{35}$$

$$4x + 3y = 3$$

$$4x = 3 - 3y$$

$$4x = 3 - 3 \cdot \frac{83}{35}$$

$$4x = \frac{105 - 249}{35}$$

$$x = \frac{-144}{4 \cdot 35} = -\frac{36}{35}$$

$$x = -\frac{36}{35}$$
$$y = \frac{83}{35}$$

3. $\frac{2}{3}x + \frac{1}{6}y = \frac{2}{3}$ / · 6
 $4x + y = 4$

$$4x + y = 4$$
$$4x + y = 4$$

⇒ same equation.
Solutions are

$x, y = 4 - 4x$
where x is any
real number.

4.

$$\begin{aligned} 2x - 3y &= 8 \\ -6x + 9y &= 10 \end{aligned}$$

/ . 3

$$\begin{aligned} 6x - 9y &= 24 \\ -6x + 9y &= 10 \end{aligned}$$

} +

$$0 = 34$$

this system has
no solutions

5. Set up and solve (from lecture)

A total of \$32,000 is invested in two municipal bonds that pay 5.75% and 6.25% simple interest. The investor wants an annual interest income of \$1900 from the investments. What amount should be invested in the 5.75% bond?

$$\begin{aligned}x &= \text{amount invested @ } 5.75\% \\y &= \text{amount invested @ } 6.25\%\end{aligned}$$

$$\begin{aligned}x + y &= 32000 && / \cdot (-0.0625) \\0.0575x + 0.0625y &= 1900\end{aligned}$$

we want x , so we'll eliminate y

$$\begin{aligned}-0.0625x - 0.0625y &= -2000 \\0.0575x + 0.0625y &= 1900\end{aligned}$$

$$-0.005x = -100 \quad / \div -0.005$$

$$x = \frac{100}{0.005} = \frac{100000}{5} = 20000$$

She should invest \$20000 at 5.75%.

6. Set up and solve:

Two sandwiches and a drink cost \$4.80. Three sandwiches and three drinks cost \$9.90. How much is a sandwich and how much is a drink?

x price of sandwich
y price of drink

$$\begin{array}{r} 2x + y = 4.8 \\ 3x + 3y = 9.9 \quad / \div 3 \end{array}$$

$$\begin{array}{r} 2x + y = 4.8 \\ x + y = 3.3 \quad / \cdot (-1) \end{array}$$

$$\begin{array}{r} 2x + y = 4.8 \\ - \quad x - y = -3.3 \end{array}$$

$$x = 1.5$$

Sandwich cost \$1.5

$$y = 3.3 - x = 3.3 - 1.5 = 1.8$$

Drink costs \$1.8
